alpha-glucuronidase (EC 3.2.1.-) precursor - fungus (Trichoderma reesel)
NiAleznate names: GLRI
C;Specias: Trichodeama reesel
C;Date: 15-Aug-1996 #sequence_revision 15-Oct-1996 #text_change 03-Nov-2003
C;Accession: U74836
R;Margolles-Clark, B.; Saloheimo, M.; Siika-aho, M.; Penttilae, M.
Gene 172, 171-172, 1996
A;Title: The alpha-glucuronidase-encoding gene of Trichoderma reesei.

-!- CATALYTIC ACTIVITY: ATP + L-arginine + tRNA(Arg) = AMP + diphosphate + L-arginyl-tRNA(Arg).

-!- SUBGELLULAR LOCATION: Cytoplasmic.

-!- SIMILARITY: Belongs to class-I aminoacyl-tRNA synthetase family.
                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    STRAIN=VC-16 / DSM 4304 / ATCC 49558;

-!- TISSUE SPECIFICITY: Testis specific.
-!- SIMILARITY: Belongs to the Ser/Thr family of protein kinases.
-!- SIMILARITY: Contains 1 Tudor domain.

15-DEC-1998 (Rel. 37, Last sequence update)
15-DEC-1998 (Rel. 37, Last annotation update)
Alpha-glucuronidase precursor (EC 3.2.1.139) (Alpha-glucosiduronase)
                    CATALYTIC ACTIVITY: Acetyl-CoA + dihydrolipoamide = CoA + S-acetylddhydrolipoamide.
COFACTOR: Contains 1 covalently bound lipoyl cofactor.
SUBUNIT: Forms a 24-polypeptide structural core with octahedral
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ·

```
The invention describes a composition comprising a substance that modulates the status of a protein (1) of 340 or 283 amino acids, or of any of the 15 sequences of 259 amino acids, given in the specification, or a molecule that is modulated by the protein, where the status of the cell that expresses the protein is modulated. The compositions, proteins, polymucleotides and methods are useful for treating and detecting cancer. The STBAP-1-related proteins are useful for generating cancer vaccines. The polymucleotides are useful as tools for delineating, with greater precision, cytogenetic abnormalities in the chromosomal region that encodes STBAP-1 that may contribute to the malignant phenotype. This is the amino acid sequence of a variant of human six transmembrane
                                                                                                                                                                                                                                                                                                                                      STEAP-1; six transmembrane epithelial antigen of the prostate; cancer; cancer vaccine; delineation; cytogenetic abnormality; cytostatic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New composition comprising a substance that modulates the status of a STEAP-1-related protein, useful for treating and detecting cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                100.0%; Score 192; DB 6; Length 258; 100.0%; Pred. ```
ö
modulates the status of a protein (I) of 340 or 283 amino acids, or of any of the 15 sequences of 259 amino acids, given in the specification, or a molecule that is modulated by the protein, where the status of the cell that expresses the protein is modulated. The compositions, proteins, polynucleotides and methods are useful for treating and detecting cancer. The STEAP-1-related proteins are useful for generating cancer vaccines. The polynucleotides are useful for delineating, with greater procession, cytogenetic abnormalities in the chromosomal region that the amino acid sequence of a variant of human six transmembrane.

The compositions, proteins of polymoclectides and methods are useful for generating and detecting cancer. The STBAP-1-related proteins are useful for generating cancer vaccines. The polymuclectides are useful as tools for delineating, with greater encodes STEAP-1 that may contribute to the malignant phenotype. This is

RESULT 15

The invention describes a composition comprising a substance that modulates the status of a protein (1) of 340 or 283 amino acids, or of any of the 15 sequences of 259 amino acids, given in the specification, or a molecule that its modulated by the protein, where the status of the cell that expresses the protein is modulated. The compositions, proteins polymucleotides and methods are useful for treating and detecting cancer. The polymucleotides are useful as tools for delineating cancer vaccines. The polymucleotides are useful as tools for delineating, with greater encodes STEAP-1 that may contribute to the malignant phenotype. This is the amino acid sequence of a variant of human six transmembrane

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention describes a composition comprising a substance that modulates the status of a protein (1) of 340 or 283 amino acids or of any of the 15 sequences of 259 amino acids, given in the specification, or a molecule that is modulated by the protein, where the status of the cell that expresses the protein is modulated. The compositions, proteins, polymucleotides and methods are useful for treating and detecting cancer. The STEAP-1-related proteins are useful for generating cancer vaccines. The polymucleotides are useful as tools for delineating, with greater precision, cytogenetic abnormalities in the chromosomal region that encodes STEAP-1 that may contribute to the malignant phenotype. This is the amino acid sequence of a variant of human six transmembrane epithelial antigen of the prostate or STEAP-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              STEAP-1; six transmembrane epithelial antigen of the prostate; cancer; cancer vaccine; delineation; cytogenetic abnormality; cytostatic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention describes a composition comprising a substance that modulates the status of a protein (1) of 340 or 283 amino acids, or of any of the 15 sequences of £259 amino acids, given in the specification, or a molecule that is modulated by the protein, where the status of the polynucleotides and methods are useful for treating and detecting cancer. The STRAP-1-related proteins are useful for generating cancer vaccines. The polynucleotides are useful as tools for delineating, with greater encodes STRAP-1 that may contribute to the chromosomal region that the amino acid sequence of a variant of human six transmembrane epithelial antigen of the prostate or STRAP-1
                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New composition comprising a substance that modulates the status of a STEAP-1-related protein, useful for treating and detecting cancer.
                                                                                                                                                                                                                                                                                             STEAP-1; six transmembrane epithelial antigen of the prostate; can cancer vaccine; delineation; cytogenetic abnormality; cytostatic;

The invention describes a composition comprising a substance that modulates the status of a protein (I) of 340 or 283 amino acids, or of any of the 15 sequences of 259 amino acids, given in the specification, or a molecule that is modulated by the protein, where the status of the polymucleotides and methods are useful for treating and detecting cancer. The STEAP-1-related protein is modulated. The compositions, proteins, The polymucleotides are useful for generating and detecting cancer. The polymucleotides are useful as tools for delineating, with greater procession, cytogenetic abnormalities in the chromosomal region that encodes STEAP-1 that may contribute to the malignant phenotype. This is the amino acid sequence of a variant of human six transmembrane
                                                                                                                                                                                                                                                                                                                                                                                                                         New composition comprising a substance that modulates the status of a STEAP-1-related protein, useful for treating and detecting cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        cancer;

Novel proteins useful as diagnostic markers and therapeutic targets, particularly for prostatic cancer.

Example 3C; Page 41; 83pp; English.

This sequence represents a synthetic peptide (peptide 1) corresponding residues 14-28 of STRAP-1 (serpentine transmembrane antigen of the to

```
CC prostate, AAY58194). This peptide was used to raise polyclonal anti-STRAP CC Western blots of cell lysates from prostate and non-prostate cancer cell lines, and in immunohistochemical analysis of STRAP-1 expression. STRAP-1 cyc which exhibit a high degree of the STRAP family of proteins (AAY58194-Y58197) CC which exhibit a high degree of structural conservation, but which show no cell has been localised to chromosome 7p22. STRAP-1 is a 339 amino acid protein characterised by six transmembrane domains and intracellular N- and chermini, suggesting that it folds in a "serpentine" manner into three extracellular and two intracellular loops. STRAP-1 man and protein concernation but recein cancers. STRAP-1 man and characterised by six transmembrane domains and intracellular N- and chermini, suggesting that it folds in a "serpentine" manner into three expression is maintained at high levels and throughout all stages of certain other cancers, including bladder, colon, pancreatic and ovarian channels (from the presence of six transmembrane domains, a feature which is human strochemical staining). STRAP proteins is not known. They may be ion channels (from the presence of six transmembrane domains, a feature which is shared by certain ion channels) or gap-junction proteins (from the manner into three cell-surface and throughout all stages of concern immune responses against STRAP-expressing cells. STRAP proteins and concern cell-surface and concern capture that stransmembrane domains, a feature which is humoral immune responses against STRAP-expressing cells. STRAP proteins and concern cell-surface and concern capture responses against STRAP-expressing cells. STRAP proteins concern cell-surface and concern capture that stransmembrane domains, a feature which is shared by certain such stransmembrane domains, as STRAP proteins concern cell-surface and concern capture that stransmembrane domains cells. STRAP proteins concern cell-surface and concern capture stransmembrane domains, as feature which capture stransmembrane 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CC The present invention relates to human six transmembrane epithelial CC antigen of the prostate (STEAP) protein. STEAP gene is used in gene CC therapy. Inhibiting the development or progression of a cancer (eg. CC prostate, colon, bladder, lung, ovarian and pancreatic) expressing STEAP (CC or inhibiting growth or killing cells expressing STEAP in a patient. Treating a vertice that expresses STEAP, or inhibiting growth or comprises administering a vertice composition to the patient. Treating a vertice that expresses STEAP, or inhibiting growth or CC killing cells expressing STEAP, comprises administering to the patient a vector encoding single chain monoclonal antibody that comprises the CC that specifically binds to STEAP, such that the vector delivers the CC that specifically binds to STEAP, such that the vector delivers the CC single chain monoclonal antibody is expressed contracellularly. The present sequence is an immunogenic paptide of STEAP-1 gene is located on chromosome 7p22.3. This peptide is used to communise sheep for the generation of sheep polyclonal antibodies towards the amino-terminus of anti-STEAP-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           human secreted proteins, and encode the proteins given in AAY12261 to AAY12514, respectively. The proteins given represent the signal peptide and an N-terminal fragment of a secreted protein. The nucleic acid sequences can be used for producing secreted human gene products. They can also be used to develop products for diagnosis and therapy. The proteins obtained may have cytokine activity, cell cyroliferation/differentiation activity, haematopoiesis regulating crivity, tissue growth regulating activity, reproductive hormone regulating activity, receptor/ ligand activity, anti-inflammatory activity, receptor/ ligand activity, atti-inflammatory activity, tumour inhibition activity or other activitys. The products can be used in forensic, gene therapy and chromosome mapping promoter sequences can also be used for obtaining corresponding promoter sequences. The nucleic acids encoding the signal peptide can be used for directing extracellular secretion of a polypeptide into a cell of a call of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   libraries

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match
                                                                                                                                                 The invention describes a composition comprising a substance that modulates the status of a protein (I) of 340 or 283 amino acids, or of any of the 15 sequences of 259 amino acids, given in the specification, or a molecule that is modulated by the protein, where the status of the cell that expresses the protein is modulated. The compositions, proteins, polymucleotides and methods are useful for treating and detecting cancer. The STEAP-1-related proteins are useful for generating cancer vaccines. The polymucleotides are useful as tools for delineating, with greater precision, cytogenetic abnormalities in the chromosomal region that encodes STEAP-1 that may contribute to the malignant phenotype. This is the amino acid sequence of a variant of human six transmembrane epithelial antigen of the prostate or STEAP-1
                                                                                                        Sequence 254 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New composition comprising a substance that modulates the status of a STEAP-1-related protein, useful for treating and detecting cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        06-SEP-2001; 2001US-0317840P.

The compositions, proteins, polymucleotides and methods are useful for treating and detecting cancer. The STRAP-1-related proteins are useful for generating cancer vaccines. The polymucleotides are useful as tools for delineating, with greater precision, cytogenetic abnormalities in the chromosomal region that encodes STEAP-1 that may contribute to the malignant phenotype. This is the amino acid sequence of a variant of human six transmembrane epithelial antigen of the prostate or STEAP-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              WPI; 2003-313240/30
